This TR and Draft Resolution build on the architectural assumption, that there must be a common dictionary, which covers all different attributes and aspects of data exchange for COTS components. This architectural decision is made manifest by the choice of IEC 61360 as starting point. However, this approach completely ignores today's realities of distributed, specialized open vocabularies and ontologies build on linked data, where an exchanged data set uses different ontologies, each only covering a certain set of attributes in the exchanged file. For this reason the TR must be fundamentally rewritten before it can proceed in order to encompass today's practice in many sectors.
